

We build the cloud environment. Your team runs it. Campux builds and secures Microsoft Azure platforms, and AWS where you already run there, then trains the internal team to operate them and stays on as a retained advisor.

CORE COMPETENCIES

Architecture & landing zones

Management groups, hub-and-spoke networking, migration, delivered as code.

Automation & AI-assisted operations

Azure Automation runbooks, workflows, and document-handling agents.

Training & curriculum

Instructor-led programs for your staff, on lab tenants mirroring yours.

DevSecOps

Pipelines, policy-as-code, Defender for Cloud, least-privilege access.

FinOps & cost governance

Spend analysis, right-sizing, budgets and guardrails that hold.

DIFFERENTIATORS

Senior from day one. The engineer who scopes your work is the engineer who does it. No account layer, no junior team after the sale.

Delivered as code, in your repositories. Everything is versioned, documented, and yours. You can run it without us.

Handover, then retained advisory. We train your team to operate what we build and stay reachable afterward.

Small enough to be direct, structured enough to procure. Registered and set up for direct award, subcontract, or teaming.

REFERENCE ARCHITECTURES WE DEPLOY

- Enterprise landing zone, ALZ-accelerator aligned — management groups, policy inheritance, hub-and-spoke, delivered as Bicep.
- Secure API edge — Front Door Premium + WAF + Private Link to APIM with Entra ID, private endpoints, Defender for APIs.
- Environment refresh automation — Azure Automation parent/child runbooks, masking to a documented rule set, Log Analytics.
